ABSTRACT

The present invention is to provide a method of constructing a nucleus-implanted egg, a parthenogenetic 5 embryo and a parthenogenetic mammal each having 2 haploid genome sets originating in mammarian ova, and provides methods of constructing a nucleus-implanted egg having a haploid genome set derived from ng ovum and a haploid genome set from fg ovum, a parthenogenetic 10 embryo and a parthenogenetic mammal, which includes the steps of (1) introducing a primitive ovarian follicle egg (ng ovum) into a nucleus-deleted egg in a germinal vesicle stage (GV stage egg) and then developing them to MII phase (second meiosis metaphase) by in vitro 15 maturing and culturing to prepare a first nucleusimplanted egg, and (2) extracting MII phase chromosome from said first nucleus-implanted egg and introducing it into other MII phase egg (fg ovum) to prepare a second nucleus-implanted egg, wherein ovum from which an 20 imprinted gene that undergoes gene modification posteriori during the generation of sperm is deleted is used as the ng ovum or fg ovum.
